Class 10: Structural Bioinformatics Pt1

Jordan Prych (PID:A17080226)

Table of contents

1. The PDB Database

The main repository of biomolecular structure data is called PDB found at: http://www.rcsb.org/.

Let's see what this database contains. I went to PDB > Analyze > PDB Statistics > By Exp Method and molecular type.

```
pdbstats <- read.csv("Data Export Summary.csv")
pdbstats
```

```
           Molecular.Type   X.ray     EM    NMR Multiple.methods Neutron Other
1          Protein (only) 169,563 16,774 12,578              208      81    32
2 Protein/Oligosaccharide   9,939  2,839     34                8       2     0
3              Protein/NA   8,801  5,062    286                7       0     0
4     Nucleic acid (only)   2,890    151  1,521               14       3     1
5                   Other     170     10     33                0       0     0
6  Oligosaccharide (only)      11      0      6                1       0     4
    Total
1 199,236
2  12,822
3  14,156
4   4,580
5     213
6      22
```

Q1. What percentage of structures in the PDB are solved by X-Ray and Electron Microscopy?

```
pdbstats$X.ray
```

```
[1] "169,563" "9,939"   "8,801"   "2,890"   "170"     "11"
```

These values are characters, not numeric, so you cannot do math with these characters. Commas make them characters.

I can fix this by replacing "," for nothing "" with the`sub()`function:

```
x <- pdbstats$X.ray
sum(as.numeric(sub(",", "", x)))
```

```
[1] 191374
```

Use `install.packages()` to use the **readr** package and `read_csv()` function.

```
library(readr)
pdbstats <- read_csv("Data Export Summary.csv")
```

```
Rows: 6 Columns: 8
-- Column specification --------------------------------------------------------
Delimiter: ","
chr (1): Molecular Type
dbl (3): Multiple methods, Neutron, Other
num (4): X-ray, EM, NMR, Total

i Use `spec()` to retrieve the full column specification for this data.
i Specify the column types or set `show_col_types = FALSE` to quiet this message.
```

```
pdbstats
```

```
# A tibble: 6 x 8
  `Molecular Type`   `X-ray`    EM   NMR `Multiple methods` Neutron Other  Total
  <chr>                <dbl> <dbl> <dbl>              <dbl>   <dbl> <dbl>  <dbl>
1 Protein (only)      169563 16774 12578                208      81    32 199236
2 Protein/Oligosacc~    9939  2839    34                  8       2     0  12822
3 Protein/NA            8801  5062   286                  7       0     0  14156
```

```
4 Nucleic acid (onl~    2890   151  1521                14       3     1   4580
5 Other                  170    10    33                 0       0     0    213
6 Oligosaccharide (~      11     0     6                 1       0     4     22
```

I want to clean the column names os they are all lowercase and don't have spaces in them. Use the **janitor** package and `clean_names()` function.

```
library(janitor)
```

```
Attaching package: 'janitor'

The following objects are masked from 'package:stats':

    chisq.test, fisher.test
```

```
df <- clean_names(pdbstats)
df
```

```
# A tibble: 6 x 8

```

Total number of X-ray structures:

```
sum(df$x_ray)
```

```
[1] 191374
```

Total number of structures:

```
sum(df$total)
```

```
[1] 231029
```

percent:

```
sum(df$x_ray)/sum(df$total)*100
```

```
[1] 82.83549
```

percent of electron microscopy structures:

```
#total number of em structures
sum(df$em)
```

```
[1] 24836
```

```
#percent
sum(df$em)/sum(df$total)*100
```

```
[1] 10.75017
```

Q2. What proportion of structures in the PDB are protein?

```
#total number of proteins
sum(df[1:3, 8])
```

```
[1] 226214
```

```
#total number of structures
sum(df$total)
```

```
[1] 231029
```

```
#proportion
sum(df[1:3, 8])/sum(df$total)
```

```
[1] 0.9791585
```

Q3. Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

when searching the HIV-1 protease, there are 4,683 structures in the current PDB.

2. Using Mol*

The main Mol* homepage at: https://molstar.org/viewer/ We can input our own PDB files or just give it a PDB database accession code (4 letter PDB code).

The markdown code for inserting an image:

Figure 1: Molecular View of HSG

Q4. Water molecules normally have 3 atoms. Why do we see just one atom per water molecule in this structure?

We only see one water molecule because in Mol*, hydrogen atoms and bonds with hydrogen are not represented. Therefore, since water has two hydrogen bonds, only the oxygen atom is shown in this structure.

Q5. There is a critical "conserved" water molecule in the binding site. Can you identify this water molecule? What residue number does this water molecule have.

This water molecule is at residue number 308. Shown in images below

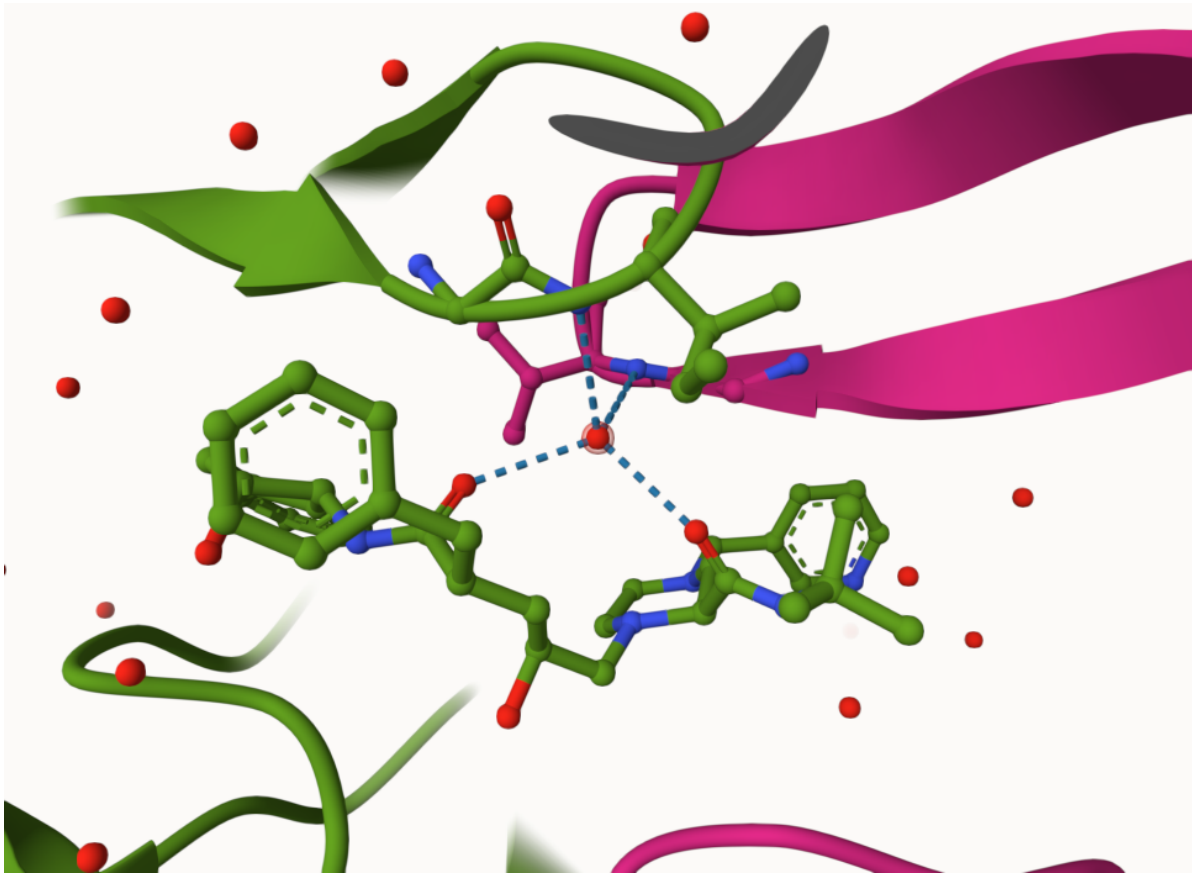

Figure 2: Water 308 in the Binding Site

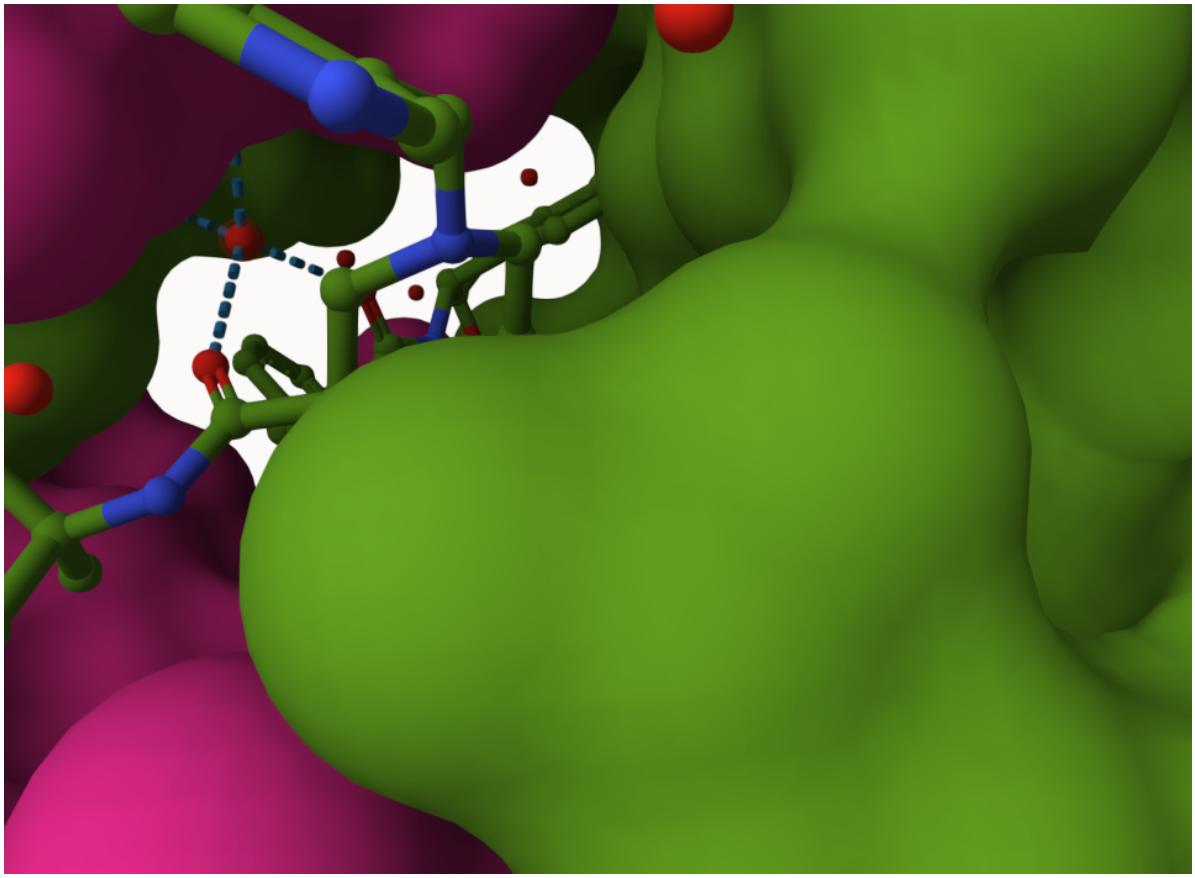

Figure 3: Surface Representation Showing Binding cavity of water 308

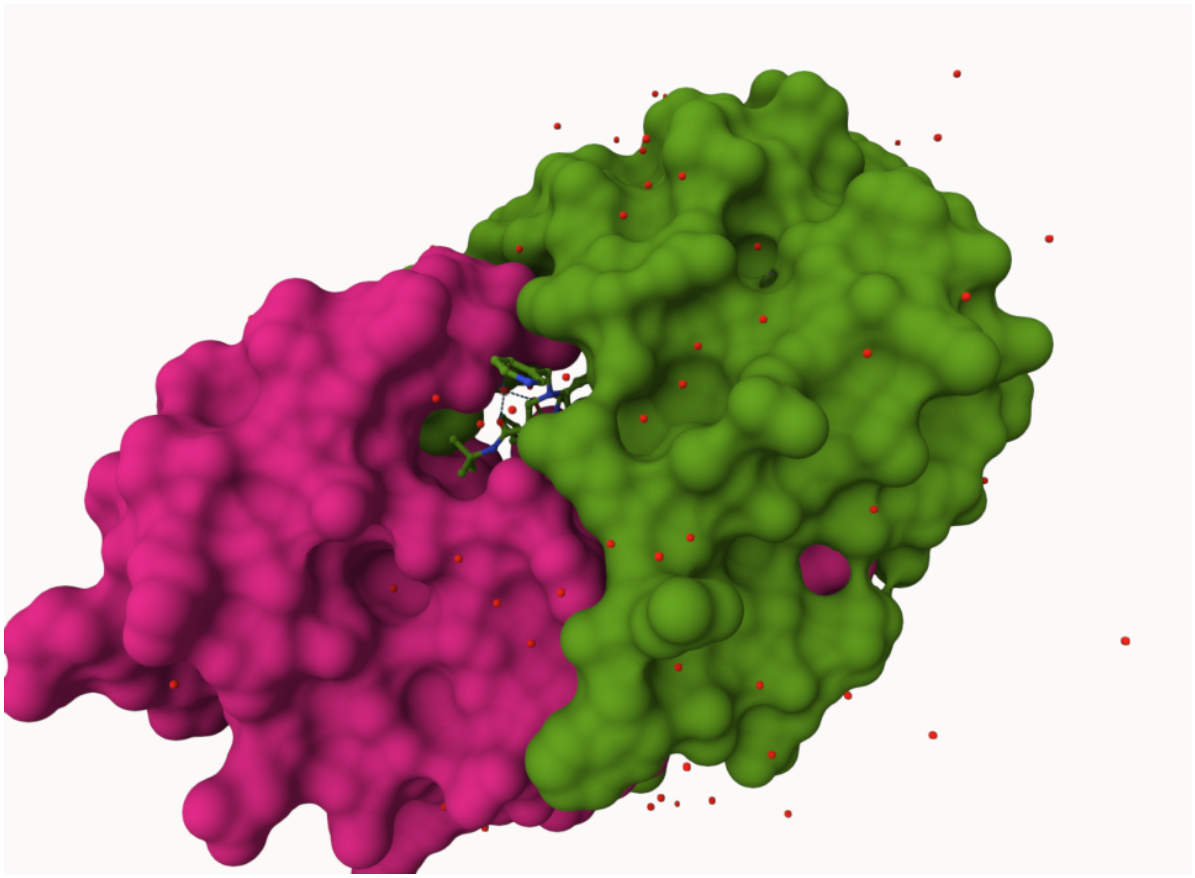

Figure 4: Overview of Surface representation of Water 308

Q6. Generate and save a figure clearly showing the two distinct chains of HIV-protease along with the ligand. You might also consider showing the catalytic residues ASP 25 in each chain and the critical water (we recommend "Ball & Stick" for these side-chains). Add this figure to your Quarto document.

Figure 5: Asp25 Amino Acid

3. Introduction to Bio3D in R

We can use the **bio3d** package for structural bioinformatics to read PDB data into R.

```
library(bio3d)

pdb <- read.pdb("1hsg")
```

```
  Note: Accessing on-line PDB file
```

```
pdb
```

```
 Call:  read.pdb(file = "1hsg")

```

```
#how many?
length(pdbseq(pdb))
```

```
[1] 198
```

Q8. Name one of the two non-protein residues?

MK1

Q9. How many protein chains are in this structure?

2 chains A and B

Looking at the `pdb` object in more detail:

```
attributes(pdb)
```

```
$names
[1] "atom"   "xyz"    "seqres" "helix"  "sheet"  "calpha" "remark" "call"

$class
[1] "pdb" "sse"
```

```
head(pdb$atom)
```

```

Let's try new function not yet in the bio3d package. It requires the **r3dmol** package that we need to install with `install.packages("rd3mol")` and `install.packages("shiny")`

```
library(r3dmol)
source("https://tinyurl.com/viewpdb")
#view.pdb(pdb, backgroundColor="pink")
```

4. Predicting Functional Dynamics

We can use the `nma()` function in bio3d to predict the large-scale functional motions of biomolecules.

```
adk <- read.pdb("6s36")
```

```
  Note: Accessing on-line PDB file
   PDB has ALT records, taking A only, rm.alt=TRUE
```

```
adk
```

```
 Call:  read.pdb(file = "6s36")

   Total Models#: 1
     Total Atoms#: 1898,  XYZs#: 5694  Chains#: 1  (values: A)

     Protein Atoms#: 1654  (residues/Calpha atoms#: 214)
     Nucleic acid Atoms#: 0  (residues/phosphate atoms#: 0)

     Non-protein/nucleic Atoms#: 244  (residues: 244)
     Non-protein/nucleic resid values: [ CL (3), HOH (238), MG (2), NA (1) ]

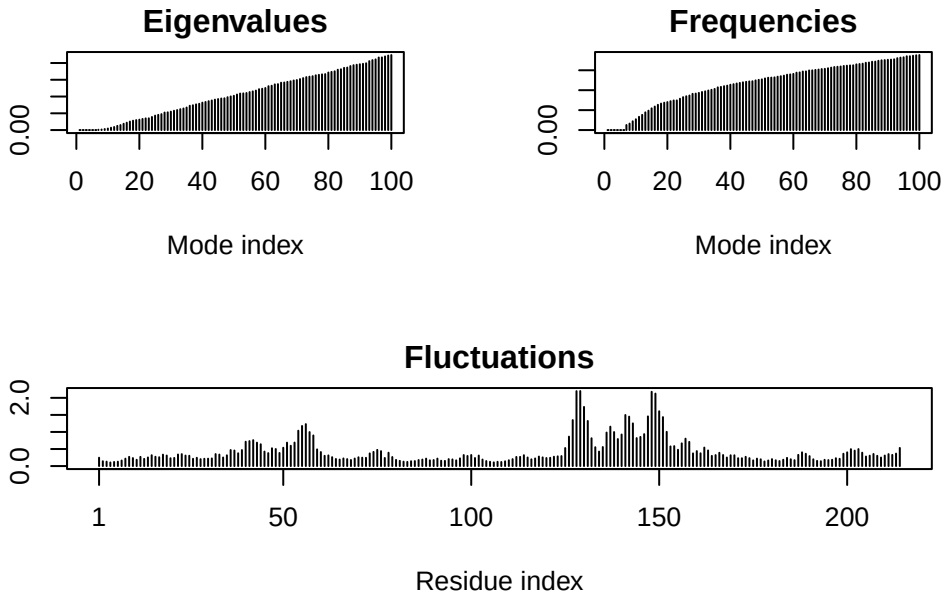
   Protein sequence:
      MRIILLGAPGAGKGTQAQFIMEKYGIPQISTGDMLRAAVKSGSELGKQAKDIMDAGKLVT
      DELVIALVKERIAQEDCRNGFLLDGFPRTIPQADAMKEAGINVDYVLEFDVPDELIVDKI
      VGRRVHAPSGRVYHVKFNPPKVEGKDDVTGEELTTRKDDQEETVRKRLVEYHQMTAPLIG
      YYSKEAEAGNTKYAKVDGTKPVAEVRADLEKILG

+ attr: atom, xyz, seqres, helix, sheet,
        calpha, remark, call
```

```
m <- nma(adk)
```

```
 Building Hessian...        Done in 0.05 seconds.
 Diagonalizing Hessian...   Done in 0.28 seconds.
```

```
plot(m)
```



Peaks are functional spots predicted to move in the molecule.

Write out a trajectory of the predicted molecular motion:

```
mktrj(m, file="adk_m7.pdb")
```

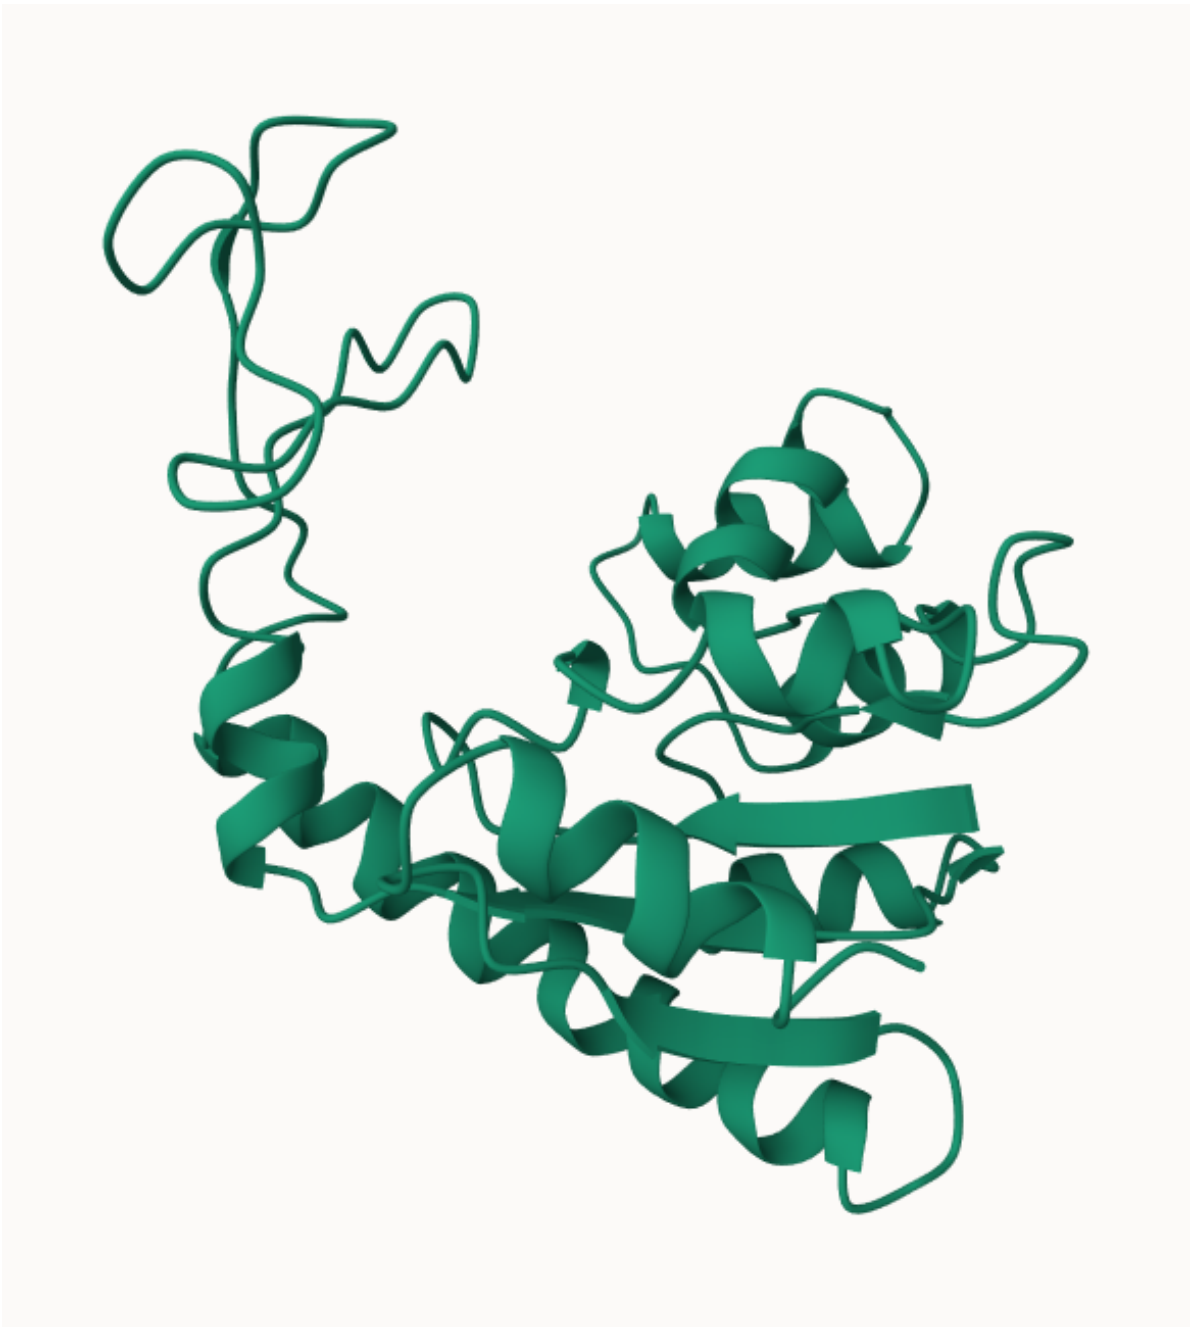


Figure 6: ADK Protein

We downloaded the animation trajectory, but this cannot be rendered into a PDF file.
